Title

```
def getMaxFromArr(arr):     return max(arr)
```

Given a 1 - dimensional array and an array of integers find the minimum that have maximum of

```
def getDiscountAmount(products):     sum = sum(products)     if sum > 75:         for i in range(len(products)):             i
```

Compute the total discounted total .

```
def getDoublon(arr):     for i in range(len(arr) - 1):         for j in range(1, len(arr)):             if i == j:                 return Tru
```

Determine if an array - like is a subset of CSVs .

```
def endString(string, ending):     return string.endswith(ending)
```

Return a string ending with ending of a endingString .

```
def endString(string, ending):     return string.endswith(ending)
```

Return a string ending with ending of a endingString .

```
def value_in_array(val,arr):     return val in arr
```

Get the value of arr from a list or arr .
